Texture

Texture Maps

How is texture mapped to the surface?

- Dimensionality: 1D, 2D, 3D
- Texture coordinates (s,t)
 - Surface parameters (u,v)
 - Direction vectors: reflection R, normal N, halfway H
 - Projection: cylinder
 - Developable surface: polyhedral net
 - Reparameterize a surface: old-fashion model decal

What does texture control?

- Surface color and opacity
- Illumination functions: environment maps, shadow maps
- Reflection functions: reflectance maps
- Perturb geometry: bump and displacement maps

History

Catmull/Williams 1974 - basic idea

Blinn and Newell 1976 - basic idea, reflection maps

Blinn 1978 - bump mapping

Williams 1978, Reeves *et al.* 1987 - shadow maps

Smith 1980, Heckbert 1983 - texture mapped polygons

Williams 1983 - mipmaps

Miller and Hoffman 1984 - illumination and reflectance

Perlin 1985, Peachey 1985 - solid textures

Greene 1986 - environment maps/world projections

Akeley 1993 - Reality Engine

Tom Porter's Bowling Pin

RenderMan Companion, Pls. 12 & 13

CS348B Lecture 11

Pat Hanrahan, Spring 2000

Direction Maps

Many ways to map directions to images...

Methods:

- Gazing Ball (N)
Create by photographing a reflective sphere
- Fisheye Lens
Standard camera lens
- Cubical Environment Map (R)
Create with a rendering program, photography...
- Latitude-Longitude (Map Projections)
Create by painting

Issues:

- Non-linear mapping - expensive, curved lines
- Area distortion - spatially varying resolution
- Convert between maps using image warp

CS348B Lecture 11

Pat Hanrahan, Spring 2000

Cubical Environment Map

Note:

- Easy to produce with rendering system
- Possible to produce from photographs
- “Uniform” resolution
- Simple texture coordinates calculation

CS348B Lecture 11

Pat Hanrahan, Spring 2000

Gazing Ball

Note:

- Photograph of reflective ball
- Reflection indexed by normal
- Maps entire field of view to circle
- Resolution function of orientation; maximum head-on
- Alternatives: Fish eye, map projections

CS348B Lecture 11

Pat Hanrahan, Spring 2000

Reflectance Maps

Integrate over a hemisphere: $BRDF * L$

Very low resolution often sufficient: At NYIT 49x49

Reflectance Maps

Reflectance map

For a given viewing direction

For each normal direction

For each incoming direction (hemispherical integral)

Evaluate reflection equation

Reflection functions

- Diffuse: Irradiance map
- Glossy: Radiance map
- Anisotropic: for each tangent direction
- Mirror: Reflection map related to environment map

Illumination functions

- Environment maps
- Procedural light sources

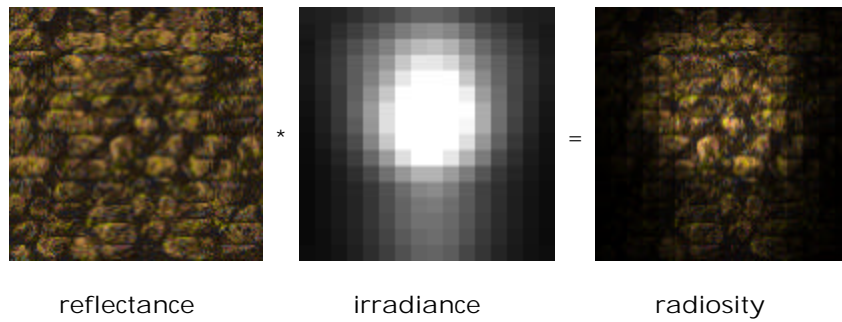

Quake Light Maps

CS348B Lecture 11

Pat Hanrahan, Spring 2000

Illumination Maps

CS348B Lecture 11

Pat Hanrahan, Spring 2000

Shadow Maps

May incorporate shadow maps into lighting calculations

CS348B Lecture 11

Pat Hanrahan, Spring 2000

Correct Shadow Maps

Step 1:

Create z-buffer of scene as seen from light source

Step 2.

Render scene as seen from the eye

For each light

Transform point into light coordinates

return $(z_l < z_{\text{buffer}}[x_l][y_l]) ? 1 : 0$

CS348B Lecture 11

Pat Hanrahan, Spring 2000

Displacement/Bump Mapping

Offset surface position

- Displacement

$$\mathbf{P}'(u, v) = \mathbf{P}(u, v) + h(u, v)\mathbf{N}(u, v)$$

- Perturb normal

$$\mathbf{N}(u, v) = \frac{\partial \mathbf{P}(u, v)}{\partial u} \times \frac{\partial \mathbf{P}(u, v)}{\partial v}$$

From Blinn 1976

Shading and Texturing Language

Flexibility

- Create procedural texture models
- Modulate multiple parameters
- Control over mapping

Texture access

```
float/color texture("image", s, t, ...)  
point bump("heights", N, Ps, Pt, s, t, ...)  
float/color environment("cubefaces", D, ...)  
float shadow("depths", P, ...)
```

Abstract Shading Model

CS348B Lecture 11

Pat Hanrahan, Spring 2000

Light Shader State

```
light bulb(  
  float intensity = 1;  
  color filament = TUNGSTEN )  
{  
  illuminate( P )  
    C1 = intensity * filament / (L.L);  
}
```

The diagram shows a light source at point P, emitting a cone of light. The light vector is L, the normal vector is N, and the position vector is P. The position vector P is also labeled with (u, v), The position vector P is also labeled with Pu and Pv.

CS348B Lecture 11

Pat Hanrahan, Spring 2000

Barzel's *UberLight.sl*

```
Example of a complex shader
UberLight( )
{
  Clip to near/far planes
  Clip to shape boundary
  foreach superelliptical blocker
    atten *= ...
  foreach cookie texture
    atten *= ...
  foreach slide texture
    color *= ...
  foreach noise texture
    atten, color *= ...
  foreach shadow map
    atten, color *= ...
  Calculate intensity fall-off
  Calculate beam distribution
}
```

CS348B Lecture 11

Pat Hanrahan, Spring 2000

Surface Shader

```
surface diffuse()
{
  color Ci = 0;
  illuminance( P, N, Pi/2 )
  Ci += Cs * Cl * N.L;
}
```

CS348B Lecture 11

Pat Hanrahan, Spring 2000

RenderMan Surface Shader

```
surface corrode(float Ks=0.4, Ka=0.1, rough=0.25)
{
    float i, freq=1, turb=0;

    // compute fractal texture
    for( i=0; i<6; i++ ) {
        turb += 1/freq*noise(freq*P);
        freq *= 2;
    }
    // perturb surface
    P -= turb * normalize(N);
    N = faceforward(normalize(calculatenormal(P)));

    // compute reflection and final color
    Ci = Cs*(Ka*ambient()+Ks*specular(N,I,rough));
}
```

CS348B Lecture 11

Pat Hanrahan, Spring 2000

Perlin's Noise Function

1. Generate a table of random numbers
2. Hash a 3D lattice into a table entry
3. Use random values as the gradient
4. Perform cubic interpolation

CS348B Lecture 11

Pat Hanrahan, Spring 2000

Turbulence

fBm

```
// compute fractal texture
for( i=0; i<6; i++ ) {
  turb += 1/freq*noise(freq*P);
  freq *= 2;
}
```
