Panoramas

CS 178, Spring 2014

Marc Levoy
Computer Science Department
Stanford University
What is a panorama?

- a wider-angle image than a normal camera can capture
- any image stitched from overlapping photographs
- an extreme aspect ratio on a normal shot
Outline

✦ capturing panoramas
✦ stitching together a panorama from multiple images
✦ perspective versus cylindrical projections
Panoramic cameras

- flatback panoramic camera
- swing-lens panoramic camera
Swing-lens panoramic images

San Francisco in ruins, 1906

101 Ranch, Oklahoma, circa 1920
Panoramic cameras

to avoid parallax errors, rotate around center of perspective

flatback panoramic camera

swing-lens panoramic camera

SLR on panning clamp

motorized pan-tilt head
Parallax errors

Photoshop aligned on the background, so only foreground objects exhibit severe parallax errors
Stanford CityBlock Project
(now Google StreetView)

✦ capture video while driving
✦ extract middle column from each frame
✦ stack them to create a panorama

Stitching images together to make a mosaic
What kind of transformation do we need?

- translation?
- rotation?
- perspective!
Quick review of perspective projection

- these three image formation methods will produce the same perspective view on the p.p. (except for the size of the view)
  - all that matters is position of c.p. and orientation of p.p.
Reprojecting an image onto a different picture plane

The sidewalk art of Julian Beever

- the view on any picture plane can be projected onto any other surface in 3D without changing its appearance as seen from a common center of projection.
Reprojecting panoramic images to a common picture plane

- the common picture plane of the mosaic replaces having had a wide-angle (non-fish-eye) camera with a large film plane in the first place
Stitching images together to make a mosaic

- **step 1**: find corresponding features in a pair of images
- **step 2**: compute perspective from 2nd to 1st image
- **step 3**: warp 2nd image so it overlays 1st image
- **step 4**: blend images where they overlap one another
- repeat for 3rd image and mosaic of first two, etc.
Stitching images together to make a mosaic

- **step 1**: find corresponding features in a pair of images
- **step 2**: compute perspective from 2nd to 1st image
- **step 3**: warp 2nd image so it overlays 1st image
- **step 4**: blend images where they overlap one another
- repeat for 3rd image and mosaic of first two, etc.

Take CS 141: Computer Vision (Aut 2014)

Also CS 478: Computational Photography (➔ Gordon Wetzstein)
Example: the Matterhorn

Common picture plane of mosaic image
Using 4 shots instead of 3

perspective projection
Cylindrical panoramas

- even works for 360° panorama
- project each image onto a cylinder
- a cylindrical image can be stored as a rectangular image
Cylindrical panoramas

- even works for 360° panorama
- project each image onto a cylinder
- a cylindrical image can be stored as a rectangular image
- to view without distortion, reproject part of the cylinder onto a picture plane representing the display screen
  - if your FOV is narrow, this view won’t be too distorted

Back to the Matterhorn

cylindrical projection

surface of cylinder
Back to the Matterhorn

surface of cylinder
As mentioned in class, Photoshop does not perform the perspective reprojection shown here. Instead, it leaves you with the raw cylindrical image shown in the previous slide. On this image, straight lines are not straight, and the edges of the original photographs appear as curves. This is not a correct linear perspective. However, some panorama viewing software does perform this perspective reprojection, e.g. Microsoft's HDView (Google for it).
As I mentioned in class, the sequence of (1) projecting one or more images to a cylindrical surface, and (2) reprojecting that cylindrical image back to a planar surface, produces an image with no distortion, i.e. it is a correct linear perspective. However, it might be rather wide-angle, as shown in the previous slide. Unless you view this image with your face close to the display, which would be the correct viewpoint for such a wide-angle perspective, it will seem distorted. We covered this issue in the first lecture of the course. To reduce the requirement that you must place yourself so close to the display, you should crop the reprojected panorama, as is done in this slide. The resulting image is not so wide-angle, and can be viewed from a normal viewing distance without seeming distorted.
Spherical panoramas

- projections are to a sphere instead of a cylinder
- can’t store as rectangular image without extreme stretching
Spherical panoramas

- projections are to a sphere instead of a cylinder
- can’t store as rectangular image without extreme stretching

“Fisheye” panorama mode in Google camera app (released May 28, 2014)
Recap

- panoramas can be captured by a camera with a wide planar back, a cylindrical back and a moving slit, or a rotating camera
  - rotate around the center of perspective to avoid \textit{parallax errors}
- to assemble panoramas from a rotating camera, use corresponding features to compute a \textit{perspective warp} that projects the images to a \textit{common picture plane}, then blend them together
- for very wide angle or 360° panoramas, project the images to a \textit{common cylindrical surface}, which can be stored as an ordinary (wide) rectangular image
  - optionally reproject them to a picture plane for display (not done by Photoshop)
- spherical panoramas are possible, but cannot be stored as rectangular images without extreme stretching of the image

calvin and hobbes

by watterson

objects no longer diminish in size with distance!

all spatial relationships are lost! it's impossible to judge where anything is! oh no!

the laws of perspective have been repealed!

lines do not converge toward any point on the horizon!

...and now she's lost perspective.

Calvin, quit running around and crashing into things, or I'll sell you to the monkey house!
